

GUIDE v.46.2 0.250-SE classification tree for predicting **death_5yr** using estimated priors and unit misclassification costs. At each split, an observation goes to the left branch if and only if the condition is satisfied. **V1** = **IGHV_MUTATION_STATUS**. Splits at nodes drawn with gray circles are not statistically significant. Predicted class and sample size (in *italics*) printed below each terminal node; class posterior probabilities for **death_5yr** = 0 and 1 beside node. Second best split variable at root node is **X17p_status**.
